

Polyurethane Grouting

SHALLOW SOIL AND STRUCTURAL STABILIZATION

Strengthen Shallow Soils

Polyurethane Chemical Grouting is one of the best ways to remediate weak, shallow soils or to fill voids under weakened structures and slabs. Because severe structural damage can result from shallow voids, immediate and conclusive repair is extremely important. The impermeable formation that results from chemical grouting gives long-term stability to the treated area.

Chemical Grouting is an excellent solution for shallow voids that occur less than 10 feet deep from the surface. The Chemical Grouting process consists of a low pressure injection technique to fill narrow crevices, pores, and loose soils.

Settlement Remediation for:

Structures
Pool Decks
Seawalls
Manholes
Driveways
Infrastructure

Installation Procedure

The injection rods are penetrated through holes the size of a nickel. The rods are typically spaced in a 5 foot grid pattern over the treatment area. The expanding polyurethane foam is injected under high pressure as the rods are raised from the deepest point to the surface.

Helicon is also able to realign weakened foundations by gently raising the foundation upward, stabilizing while densifying loose soils. The degree of lift is a controlled and precise operation that requires experienced Polyurethane Chemical Grouting professionals.

Polyurethane Grouting Applications

Structures

Pool Decks

Seawalls

Manholes
